

## Zebra Setup Utility, Zebra Mobile Printer, ACS, Symbol / Motorola Access point, PEAP and WPA-PEAP

This section of the document illustrates the Cisco ACS radius server and how PEAP and WPA-PEAP was configured on this server.

This document is meant as an illustration only. Questions on the setup of ACS should be directed to Cisco. It should be Cisco that is used to determine if the illustration below is appropriate for your environment.

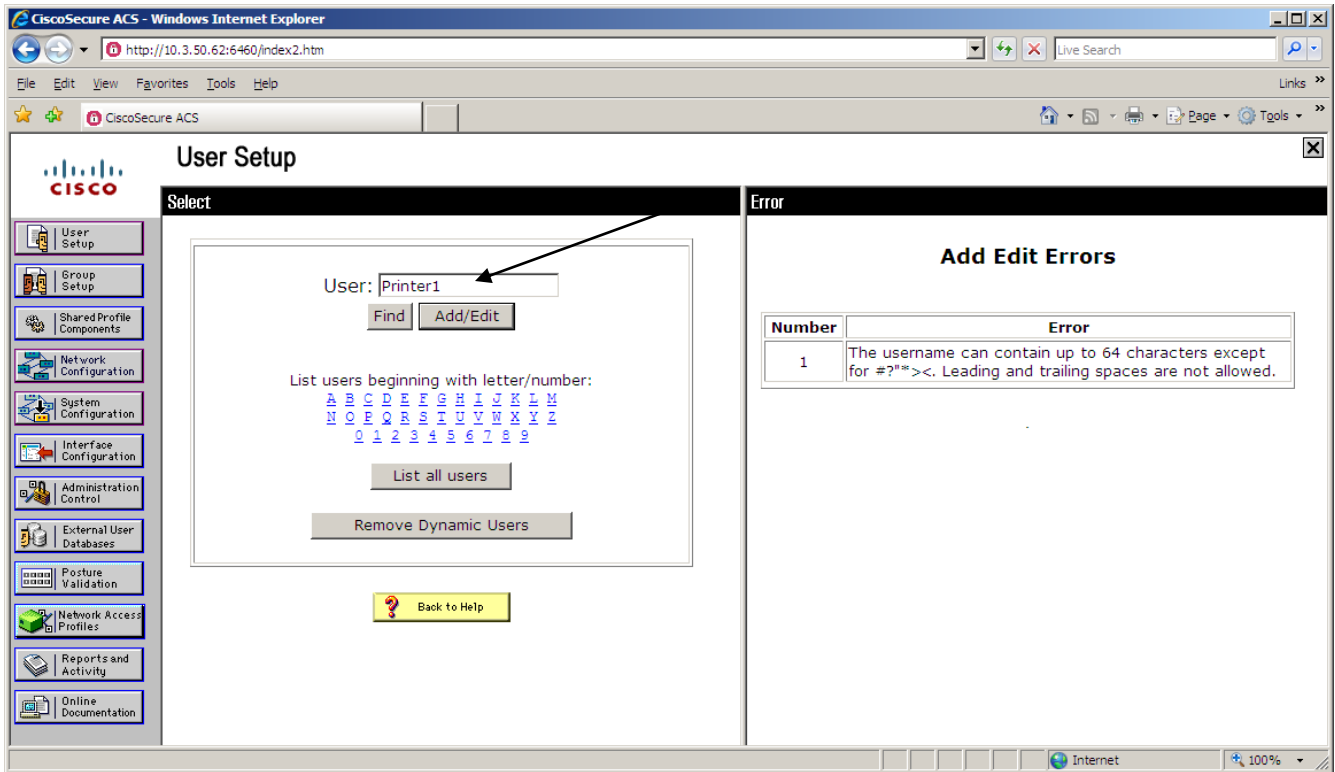

It is important to note that the setup on the ACS server did not differ when using WPA-PEAP or PEAP.

The first series of screenshots shows how a Radius client is added to ACS. In the screenshot below a Symbol/Motorola Access Point with the IP address of 10.3.50.72 is added. The ACS server needs to have a client in the clients table to ensure that authentication requests are only being received from valid clients.

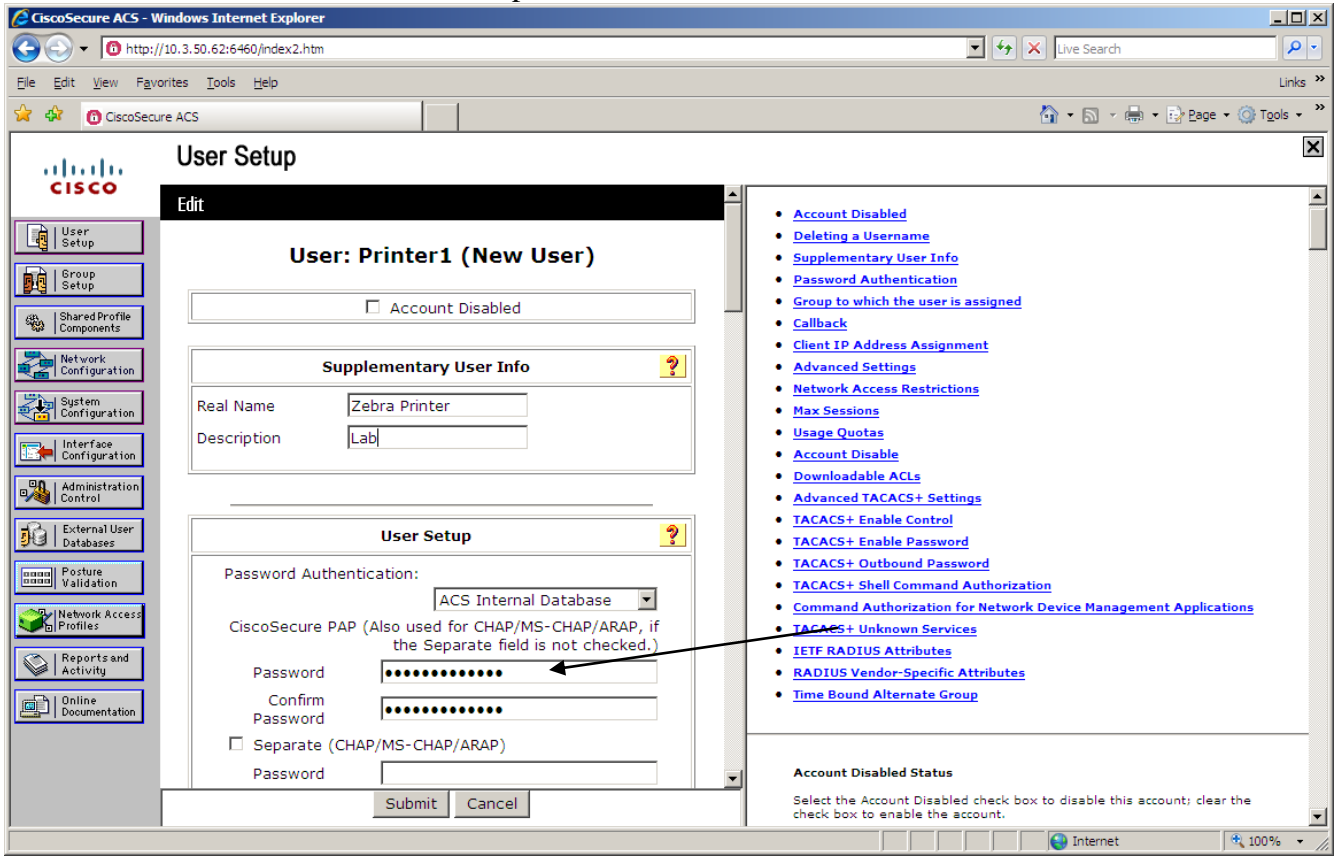

A secret key is entered on the ACS server. This secret key needs to match the secret key on the radius client ( in this example the Symbol/Motorola Access Point).

A username is entered for the printer and a password for the printer is also added. In this example the username is Printer1.

The screenshot below shows where the password is added.

In the system configuration on the ACS server, I have illustrated in the screenshot below that PEAP is enabled.

- [PEAP](#)
- [EAP-FAST](#)
- [EAP-TLS](#)
- [LEAP](#)
- [EAP-MD5](#)
- [AP EAP Request Timeout](#)
- [MS-CHAP Configuration](#)

**EAP Configuration**

EAP is a flexible request-response protocol for arbitrary authentication information (RFC 2284). EAP is layered on top of another protocol such as UDP, 802.1x or RADIUS and supports multiple "authentication" types.

[\[Back to Top\]](#)

**PEAP**

PEAP is the outer layer protocol for the secure tunnel.

*Note: PEAP is a certificate-based authentication protocol. PEAP authentication can occur only after you have completed the required steps on the ACS Certificate Setup page.*

CiscoSecure ACS

## System Configuration

Certificate Binary comparison

EAP-TLS session timeout (minutes):

Select one of the following options for setting username during authentication:

- Use Outer Identity
- Use CN as Identity
- Use SAN as Identity

**LEAP**

- Allow LEAP (For Aironet only)

**EAP-MD5**

- Allow EAP-MD5

AP EAP request timeout (seconds):

#### MS-CHAP Configuration

- Allow MS-CHAP Version 1 Authentication
- Allow MS-CHAP Version 2 Authentication

**EAP Configuration**

EAP is a flexible request-response protocol for arbitrary authentication information (RFC 2284). EAP is layered on top of another protocol such as UDP, 802.1x or RADIUS and supports multiple "authentication" types.

[\[Back to Top\]](#)

**PEAP**

PEAP is the outer layer protocol for the secure tunnel.

*Note: PEAP is a certificate-based authentication protocol. PEAP authentication can occur only after you have completed the required steps on the ACS Certificate Setup page.*

The screenshots below shows how a successful authentication appears on the ACS server.

The screenshot displays the CiscoSecure ACS web interface. The main content area is titled "Reports and Activity" and shows a report for "Authentications active.csv". The report includes a table with the following data row:

Time	Message-Type	User-Name	Group-Name	Caller-ID	NAS-Port	NAS-IP-Address	Network Access Profile Name	Shared RAC	Downloadable ACL	System-Posture-Token	Application-Posture-Token	Reason	EAP Type	EAP Type Name	PEAP/EAP-EAST-Clear-Name	Access Device
11:12:54:18	Authen OK	Printer1	Default Group	00:19:70:13:9f:6a	1	10.3.50.72	(Default)	..	..	..	..	..	25	MS-PEAP	..	Symbo_Motorola_

This section of the document illustrates a **Symbol / Motorola Access Point**

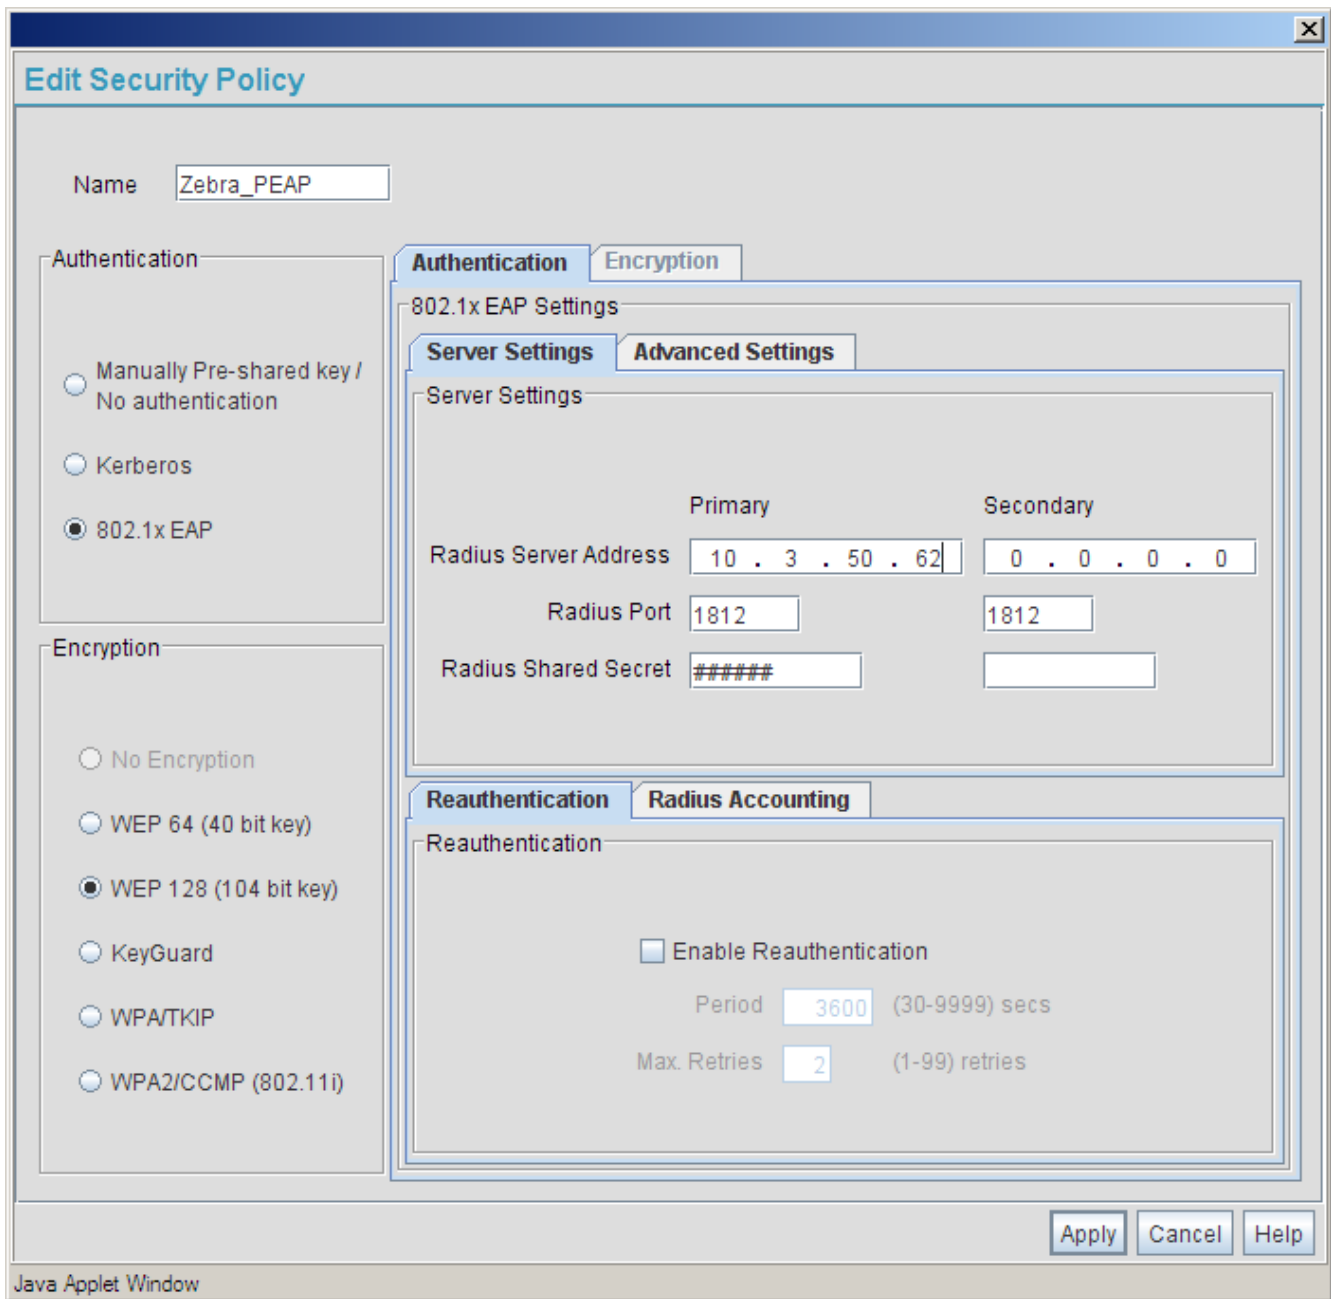

This document is meant as an illustration only. Questions on the setup of your Symbol / Motorola Access Point should be directed to Motorola. It should be Motorola that is used to determine if the illustration below is appropriate for your environment

This illustration shows how the Symbol/Motorola Access Point was configured for PEAP initially and then configured for WPA-PEAP.

With PEAP or WPA-PEAP the authentication request is forwarded to a Radius server.

The first step in this illustration is adding a security policy for **PEAP**.

The example below shows an entry of a radius server with an IP address of 10.3.50.62 (Cisco ACS server) and utilizing the port number of 1812. 1645 and 1812 are common port numbers used with the RADIUS protocol. A secret key is also entered. This secret key needs to match the secret key that is entered on the RADIUS server.

The next step illustrated here is how an ESSID is created. The ESSID in this illustration is “Zebra\_PEAP”. Please note that ESSIDs are case sensitive. In this illustration, I have assigned the security policy that I have entered previously (Zebra\_PEAP)

**New WLAN**
